INTRODUCTION

The City of Buffalo Department of Public Works (DPW) is submitting the 2026–27 Winter Snow Plan (the "Snow Plan") as an annex to the City of Buffalo Comprehensive Emergency Management Plan (CEMP), administered by the Office of Emergency Management & Resiliency (EM&R). This annex outlines DPW's primary responsibilities for snow clearing, plowing, and removal during the upcoming winter season, including operational deployment of City-owned resources, coordination with private contractors, and tactical collaboration with other municipal public works agencies.

While this plan provides both general and specific information related to snow clearing/plowing, snow removal, icy conditions and other winter conditions, each winter weather event is unique, and extreme weather is the new normal. Continual review of ongoing operations and current weather conditions may dictate a change in tactics or a shift to an alternative approach not specifically outlined in this Snow Plan. The DPW will adjust its response as required during the event.

Located on the tip of Lake Erie, the City's weather patterns and weather event impacts can vary drastically from one event to the next and, as we all know, change constantly, even during weather events. The fluid nature of weather mandates a plan, but requires an acute awareness of conditions and the ability to adjust as needed during the event. However, winter weather events can include damaging winds (trees downed and power outages), freezing rain/ice (power outages and extreme travel difficulties), lake seiche (lake shore flooding), ice jams (creek flooding), among other concerns. The DPW constantly monitors conditions that impact all areas and aspects of the City and responds/coordinates with other departments and agencies as required.

The mission of the DPW is to serve all of the residents with the same care and consistency across the City. DPW's main goal is to maintain our City streets to be passable and safe for all users as consistently and as quickly as possible, while recognizing the limitations imposed by weather conditions and the availability of equipment, materials and personnel resources. A primary focus is to ensure that emergency vehicles and personnel can respond to life threatening emergencies in any conditions.

The City's response to winter events varies based on the impact of the event. Smaller snow events (typically measured in inches) or minor ice events require a baseline DPW response. Larger snow events (measured in feet of snow) require a more robust effort, potentially involving multiple departments and agencies, and are led through the Mayor's Office with close coordination and support from the Emergency Services Manager.

Created during the December 2022 blizzard, the Emergency Services Manager (ESM) leads citywide emergency management efforts, including planning, training, risk monitoring, interagency coordination, and strategic oversight, within the Office of Emergency Management and Resiliency (EM&R), formally established by the Mayor under Executive Order 2025-01.

During weather events and other emergencies, the Emergency Services Manager coordinates responses across all City departments, ensures the efficient allocation of resources, and aligns operations with the CEMP. The Emergency Services Manager works across all City departments to achieve the common goal of keeping Buffalo safe. Reporting directly to the Mayor, this position ensures that the City's emergency response is integrated, citywide, and consistent with both policy and operational priorities.

The Snow Plan is organized around a three-tiered approach to winter response:

1. **Operational Lead – DPW**: Responsible for snow clearing, plowing, and removal operations, including City-owned and contracted equipment.

2. **Strategic Coordination – EM&R / Emergency Services Manager**: Oversees incident management, prioritizes resources, coordinates across city departments, and serves as a liaison with neighboring municipalities, Erie County, New York State, and relevant federal agencies.

3. **Policy Oversight – Mayor's Office / Executive Leadership**: Oversees emergency declarations, prioritization of critical services, and engagement with state and federal partners to ensure citywide objectives and public safety priorities are met.

This tiered framework ensures that Buffalo's winter response is coordinated at the operational, strategic, and policy levels, integrating DPW operations into the broader citywide emergency management structure and aligning with the Comprehensive Emergency Management Plan (CEMP).

PART ONE

Operational Framework

GENERAL PREPAREDNESS

The Winter Snow Plan consists of several components, considerations, and variables that are considered during winter weather events. The DPW follows a framework for snow removal that is based upon **three states of readiness**: **"Snow Alert" status, "Snow Plowing" status, and "Snow Emergency" status.**

In addition to DPW's operational responsibilities, the Emergency Services Manager (ESM), established under Executive Order 2025-01, provides citywide strategic coordination. The ESM ensures that DPW operations, other City departments, and interjurisdictional partners are aligned with the Comprehensive Emergency Management Plan (CEMP) and overall emergency response priorities. This includes monitoring conditions, ensuring resources are appropriately allocated, and coordinating with the Mayor's Office on policy and executive-level decisions as necessary.

SNOW ALERT

Snow Alert Status is the City's routine winter-weather preparedness condition established when a snowfall event is anticipated and forecast conditions warrant increased readiness and coordination. Routine duties will be performed by DPW personnel with snow fleet vehicles (plow trucks and front-end loaders) assigned to pre-determined routes, with flexibility to be assigned to specialized routes utilizing turn by turn routing systems developed in conjunction with MIS. The snow fleet vehicle inventory is provided in the Exhibits. Snow fleet equipment and personnel are assigned to their appointed routes within their specific plowing district to begin operations. The defined plowing districts are provided in the Exhibits.

In preparation for any winter event, as the National Weather Service Buffalo (NWS) begins to identify potential storm or severe weather, the Emergency Services Manager (ESM) provides NWS forecasts and predictions throughout the year, increasing frequency and detail when a potential or actual severe weather event is pending. The ESM shares these forecasts and communicates with all City agencies and department leadership to promote situational awareness, evaluate potential impacts on essential services, and inform strategic planning for citywide operations. In addition to data from NWS, the City will also monitor forecasts and modeling from the Mesonet system, administered by the State of New York through a partnership with the University at Albany.

When needed, the ESM schedules and hosts inter-agency conference calls with NWS, county, and state partners to review potential impacts, strategic concerns, and resource needs, and to facilitate pre-planning of the City's response. During these calls, DPW works in coordination with the ESM, providing operational input, sharing resource availability, and ensuring tactical considerations—such as plow routes, equipment deployment, and snow removal priorities—are aligned with the broader citywide response objectives DPW and ESM collaborate to identify commonalities between strategic and operational considerations, ensuring that citywide response priorities and DPW tactical plans are aligned. The ESM focuses on strategic impact and essential service delivery, while DPW evaluates tactical and operational needs, such as plow routes, equipment deployment, and salt application. Forecast updates from NWS guide the adjustment of operational plans, resource allocation, and interdepartmental coordination. Additionally, for winter events in the "significant" or "extreme" impact categories as rated by NWS, DPW leadership will coordinate with the Erie County Commissioner of Public Works and New York State Department of Transportation Region 5 Leadership to discuss forecasted conditions, potential impacts, and interjurisdictional cooperation.

The ESM coordinates with all City agencies adjustments to ensure essential services are maintained during the winter event. Incident objectives are established, reviewed, and updated as conditions evolve. In coordination with the Mayor's Office, the ESM oversees public warning and messaging efforts to ensure consistent and timely communication with residents. The ESM also monitors 311 complaints and service requests to identify emerging issues, service gaps, or operational challenges, and works with appropriate departments to address them proactively creating or readying contingencies as needed to mitigate potential impacts.

Within this timeframe, the ESM facilitates a pre-incident briefing with leadership from City departments and agencies, including:

- **Department of Public Works (DPW)** – operational planning, snow removal, equipment deployment, and tactical coordination
- **311 Call and Resolution Center** – public information and intelligence gathering
- **Parks Department –** targeted operational support
- **Buffalo Fire Department** – staffing, emergency response, and essential service delivery
- **Buffalo Police Department** – traffic and public safety coordination
- **Buffalo Water** – monitoring and response for water supply and infrastructure
- **Parking Department**– enforcement of winter parking regulations to support snow clearing

- **Community Services and Citizen Services** – public notifications, resource assistance, and community support
- **Real Estate Division** – management of city property and snow removal on municipal sites

During this briefing, each agency provides their strategy, resource allocation and utilization plans, and operational priorities. The ESM, in coordination with the participating agencies, defines the incident objectives and the operational period timeframe for the incident, and determines the need for activation of the City of Buffalo Emergency Operations Center (EOC) to coordinate citywide response, as required based on the scope and potential impacts of the event.

SNOW PLOWING

When a weather event starts, the DPW will commence salt and/or plowing operations according to anticipated weather conditions. After the snow fleet equipment is dispatched to assigned plowing areas, drivers and operators are in constant radio communication with DPW Dispatch located at the DPW Snow Hub facility, operating under direct supervision of Supervisors who cover shifts 24 hours per day. Although snow fleet equipment is assigned to every district across the City, if there are areas that are experiencing a heavier/ lighter rate or depth of snowfall than others, snow fleet equipment may be reassigned. Based on the severity of the storm, there may be a more significant prioritization of mains and secondaries, as well as designated snow routes to facilitate the movement of emergency personnel.

When weather conditions subside, the DPW focus shifts to a more detail-oriented clean-up of roadways (clearing snow from curb to curb in the street) or snow removal (hauling of snow to designated locations) if required. The key element for this potential removal is preparing the City's streets and infrastructure for the next snow event that occurs – creating the "capacity" in the streetscape for additional snow plowing. Following the clean-up and/or removal of snow, the DPW returns to Snow Alert status.

The DPW's goal is to have every street across the City plowed, at least one pass, within 24 hours after the end of a snow event. The ability to meet this goal can be adversely affected by the continuance of the weather event or extreme weather impacts as well as the parking conditions that exist on City streets. All residents are asked to follow the winter parking regulations across the City, which allows for the City's snow plowing/clearing equipment to pass through City streets. If residents are not following the winter parking regulations or parking in the snow clearing lane, snow plowing/clearing efforts on streets will be slowed, if not blocked completely. Compliance with the winter parking regulations by our residents will impact the DPW's ability to effectively access and clear streets. To address this challenge the Department of Parking has scaled up their capacity for the 26-27 snow season with additional personnel and tow trucks. DPW and Parking will work in conjunction to clear vehicles impeding the work of plow crews.

OUTDOOR RECREATIONAL FACILITIES & BIKE FACILITIES

During winter weather events, the DPW also prioritizes the safe and functional maintenance of the City's outdoor recreational and bicycle facilities. Snow clearing of protected bike lanes, off-street paths, and other dedicated cycling spaces will occur in conjunction with DPW's snow services on residential streets, consistent with the City's goal of completing at least one pass on every street within 24 hours of the end of a snow event.

Following residential plowing, the DPW, Parks and Olmsted will coordinate snow plowing/clearing of key park loops to allow continued circulation in priority park areas.

Vertical delineators installed to separate bike facilities from travel lanes present unique winter maintenance challenges. At the start of each winter season, the City will identify and document all delineators in the right-of-way and assess their compatibility with winter maintenance equipment. In locations where plowing equipment can safely accommodate them, delineators will remain in place. In other locations—typically where narrow clear zones, sharp turning radii, or heavy snow accumulation increase the risk of damage—delineators will be temporarily removed and reinstalled when winter conditions abate. This systematic approach reduces maintenance disruptions, protects City assets, and promotes safer winter cycling.
Effective winter maintenance is essential for ensuring that bike facilities remain predictable, accessible, and well-connected throughout the season, supporting year-round mobility even in a cold weather city.

SNOW EMERGENCY RESPONSE

EMERGENCY STATUS

A State of Emergency is declared when snow plowing equipment and routine DPW operations are insufficient to keep main roads and emergency facilities accessible, clean, and safe due to excessive snow accumulation that poses a detriment to the health, safety, and welfare of the public. **State of Emergency conditions will typically occur during Tier 2 or Tier 3 winter events, as described in the following pages**.

The Mayor, in consultation with the Deputy Mayor, DPW Commissioner, Emergency Services Manager (ESM), Police and Fire Commissioners, and Corporation Counsel, declares the State of Emergency pursuant to NYS Executive Law Article 2-B, Section 24, which grants local chief executives the authority to declare a local state of emergency and issue local emergency orders to protect life and property or to bring an emergency situation under control.

Key emergency orders during a snow event can include driving bans, the suspension of procurement rules, and the suspension of certain workplace rules.

EMERGENCY OPERATIONS CENTER (EOC) ACTIVATION

The City of Buffalo Emergency Operations Center (EOC), located at Police and Fire Headquarters in the Dillon Public Safety Building, may be proactively activated or operate in a forward-leaning posture even when no formal State of Emergency has been declared, providing incident management, coordination, and resource allocation during significant snow events. The EOC serves as the command center for citywide response, maintaining situational awareness, aligning departmental actions, and coordinating resources across all City agencies and departments. The EOC remains active until the State of Emergency is lifted, if declared, or until the event concludes and citywide operations return to routine status.

DAILY OPERATIONS BRIEFING

During the operational period, the ESM facilitates daily operations briefings with participating agencies and departments. Each agency provides an overview of accomplishments during the current operational period, including completed tasks, resource utilization, challenges encountered, and any unmet needs that may require additional support or prioritization. Agencies also outline anticipated assignments and operational priorities for the upcoming operational period, ensuring alignment with the overall incident objectives defined by the ESM.

These briefings allow the ESM to maintain situational awareness across all City departments, adjust strategies as needed, coordinate interdepartmental efforts, and determine whether additional resources or changes in operational approaches are required.

DAILY SITUATIONAL REPORTS (SITREPS)

Information gathered during operations briefings, together with other relevant operational information, is compiled into daily situational reports (SITREPs). SITREPs are produced at pre-defined times or in accordance with the incident's operational battle rhythm. SITREPs provide leadership and external stakeholders with a consolidated overview of current conditions, significant actions and developments, resource status, emerging needs, operational concerns, and priorities for upcoming operational period.

SITREP information also provides an ongoing record of incident-related actions, resource utilization, impacts, and unmet needs that can support subsequent recovery activities, damage assessment, cost documentation, and other post-incident requirements.

During a significant or extreme event, the Emergency Operations Center will be activated with 12-hour operational periods.

ROLE OF THE EMERGENCY SERVICES MANAGER (ESM)

During EOC activation, ESM provides strategic oversight and oversees citywide incident management to ensure essential services across all City departments remain operational.

The ESM:

- Defines and updates incident objectives in coordination with participating agencies and the Mayor's Office.
- Oversees citywide incident management and inter-agency coordination, working with Police, Fire, DPW, and other operational departments to align operational actions with established citywide priorities and incident objectives.
- Facilitates coordination among City agencies, departments, and external partners as needed to address operational impacts, resource needs, and emerging issues.
- Supports public warning and messaging, in collaboration with the Mayor's Office.
- Monitors 311 complaints and service requests to identify emerging issues affecting essential services or operational response.
- Authorizes forward-leaning activation of Emergency Warming Centers and other essential resources or services based on forecasted severity, rather than waiting for a specific Tier

threshold, ensuring residents have access to safe shelter and critical support prior to event impacts.
- Determines EOC staffing needs and resource allocation, ensuring citywide priorities are addressed in accordance with the established EOC Activation Level.
- Manages City EOC operations during region-wide events, overseeing citywide incident management, inter-agency coordination, resource allocation, and essential services. City personnel may be assigned to the County EOC to support overall incident coordination and maintain alignment across participating agencies and jurisdictions.

EOC ACTIVATION AND COORDINATION

The Emergency Services Manager (ESM) determines the need for Emergency Operations Center (EOC) activation based on the scope, potential or actual impacts, resource requirements, operational complexity, and need for citywide coordination associated with the winter weather event.

EOC activation may occur independently of a formal State of Emergency declaration and is not automatically determined by the Snow Plan winter event tier. The winter event tier provides a framework for assessing the anticipated or actual severity and operational impacts of the event, while EOC activation is determined based on the City's need for enhanced coordination, situational awareness, resource coordination, and executive decision support.

EOC activation levels, staffing requirements, organization, and operational procedures are established in the City of Buffalo Comprehensive Emergency Management Plan (CEMP) and are incorporated by reference into this Winter Weather Operations Plan.

WINTER EVENT TIERS

The City's winter weather response is organized according to the following winter event tiers, which are defined in this plan:

TIER 1	**General Snow Event** (Typical Winter Snowfall)
TIER 2	**Localized Large-Scale Extreme Snow Event** (Singular Area of the City Impacted)
TIER 3	**Citywide/Regionwide Extreme Snow Event/Blizzard** (Entire City Impacted)

TIER 1 – GENERAL SNOW EVENT
Typical winter snowfall

Tier 1 weather events account for the majority of snowfall events in the City of Buffalo and are handled predominantly by City of Buffalo resources. Typical events within Tier 1 are as follows:

- Singular snow events with a limited snow total.
- Multiple snow events over days with lower rates of snow.

Tier 1 events as outlined above will be handled by the DPW Snow Fleet. If needed, the DPW will contact the New York State Department of Transportation (NYSDOT) to request assistance to plow certain state-designated routes within the City limits. The primary goal in the snow plow operation is to initially focus on primaries and secondaries and streets/thoroughfares surrounding critical City services and/or life-saving facilities – critical City service facilities, fire houses, warming centers and police stations as identified in the Exhibits. Following those initial focal points, the DPW fleet will transition to residential streets with the goal of completing at least one pass on all residential streets within 24 hours after the snow event ends.

It is important to note that clearing snow does not take the same amount of time regardless of the snowfall depth (amount of snow) or snowfall intensity (heavy, wet snow or lighter, dry snow) received. This will affect the time to transition to residential streets as well as the time required to clear the streets in general.

TIER 2 – LOCALIZED LARGE-SCALE EXTREME SNOW EVENT
Singular Area of City Impacted

SCOPE AND CHARACTERISTICS

Singular areas of the city are impacted. Tier 2 weather events may encompass numerous conditions; generally, they include high snowfall amounts over multiple days or a singular, short-term event with larger snow totals, in one portion of the City. Snowfall in other parts of the city may be minimal. Snowfall rates for a Tier 2 storm will potentially exceed 3" per hour, a rate that may prevent regular plowing from keeping the city passable.

OPERATIONAL RESPONSE

Tier 2 events deposit snow amounts beyond the ability of standard DPW plow trucks. Snow must be removed rather than merely plowed. DPW resources, along with City-engaged private contractors and/or Erie County and NYSDOT facilitated contractors, are deployed for snow removal as outlined in the Snow Fleet section.

- **DPW fleet resources** focus on plowing primaries and secondaries, and streets surrounding critical City service and/or life-saving facilities, as well as areas with less significant snowfall. DPW also deploys its own front loaders to participate in the lift and dump operation.
- **Outside contractor resources** are dedicated to removing snow in areas with excessive accumulation. A record amount of funding has been budgeted for outside contractors in the 26-27 budget, sufficient for one major citywide storm, or two localized events.
- **Pre-storm mobilization and pre-positioning** of equipment, including front end loaders for Fire, Police, and Parking Divisions, is implemented in forecasted severe impact areas.
- **Tracked vehicle pre-positioning** from Erie County may occur if there is a belief that Advanced Life Support (ALS) service may not be possible due to extreme conditions. Erie County has a fleet of tracked vehicles that can be staffed by trained EMS personnel who can respond to critical ALS calls even in extreme conditions.
- **Appropriate pre-event public** communication will be deployed including BuffAlerts and potentially IPAWS alerts.

DPW SNOW HUB

The DPW Snow Hub manages day-to-day snow clearing and removal operations, including tactical decisions on plow routes, equipment deployment, and contractor coordination.

CITY EOC
Upon activation, the City of Buffalo EOC provides citywide strategic oversight and coordination both within City departments (intra-agency) and with external partners (inter-agency/jurisdictional). Led by the Emergency Services Manager (ESM), the EOC aligns operational priorities across all City departments, ensures essential services are maintained, monitors broader impacts, and facilitates coordination with county, state, federal, and other partner agencies.

- **Primary City EOC location:** Police and Fire Headquarters, Dillon Public Safety Building, 68 Court Street, Buffalo, NY 14202

- **Alternate City EOC location:** Erie County Emergency Operations Center, 3359 Broadway Avenue, Cheektowaga, NY 14227

Note: Ongoing snow removal operations continue to be managed from the DPW Snow Hub, with coordination and collaboration with the EOC, where DPW liaison officers (LNOs) provide operational updates and ensure alignment with citywide strategic guidance and support.

TIER 3 – CITYWIDE/REGIONWIDE EXTREME SNOW EVENT/BLIZZARD
Entire City Impacted

Tier 3 weather events may encompass numerous conditions, however, they will generally include an excessive region-wide snowfall from a singular, short-term or a continuous, excessive multiple-day event across the entire City. Winds may or may not be part of the weather event, however, this type of event can be catastrophic in nature.

Similar to Tier 2 events, Tier 3 events as outlined above deposit snow amounts greater than the ability of the DPW to plow. As such, Tier 3 events will require snow removal efforts. A Tier 3 event will be handled by a coordinated combination of DPW resources and any combination of City-engaged private contractors and/or Erie County facilitated private contractors and/or New York State facilitated contractors/municipal partners performing snow removal efforts. As the weather event has impacted the entirety of the City, the response network of equipment will be distributed across the City as well.

Per protocols established after the 2022 Christmas Blizzard, during a citywide purple "extreme" NWS storm, the City will be divided into three areas of responsibility. Buffalo **DPW will handle the City north of Broadway and East of Main St. Erie County will be responsible for the City south of Broadway**. NYSDOT will be responsible for the area north of Broadway west of Main. The type and extent of the weather event may necessitate a redistribution of assignments between agencies as necessary.

Response efforts are focused on critical infrastructure and life safety efforts, then will transition to snow clearing/plowing and snow removal efforts. For snow removal coordination, the DPW will coordinate and direct the City, County and State equipment across the affected region. This will expedite the clearing of the entire City and reduce potential duplication of efforts. Priority routes will include maintaining primary access to the hospitals, the Holding Center, and other critical 24/7 infrastructure.

As in Tier 2 events, Tier 3 events will be coordinated at the DPW Snow Hub established at the outset of the storm. Pre-placement of contractor resources (snow removal equipment mobilized before the storm arrives) is an element to the response that will be emphasized for Tier 3 events.

Additionally, individual front end loaders from contractors will be dedicated to the Fire and Police Departments (one front end loader per house or station across the City) and Parking Division. This equipment will be mobilized and pre-positioned for the event. Front end loaders and dump trucks may also be mobilized and staged in the City to assist with the response.

Ongoing snow removal operations within the City will remain managed by DPW.

Several City- and County-owned facilities are available to act as warming shelters in the event of widespread power outages in one or more sections of the City. Warming shelters will only be opened preemptively in advance of a storm with a high likelihood of utility failures. Thanks to upgrades made by National Grid to Buffalo's substations, the risk of major power outages like those experienced during the Christmas Blizzard are unlikely to be encountered again.

Should warming shelters need to be opened, they will require significant staff resources and be subject to various state and local regulations. For the most part, in the face of a major snowstorm, the safest place is home.

For those who are unhoused, New York State's Code Blue Law requires local social service districts to provide shelter throughout the winter season.

OPERATIONAL ELEMENTS

In preparation and response to winter events, the DPW reviews and evaluates numerous internal and external elements. A few key elements are highlighted here for informational purposes.

WEATHER INFORMATION

Accurate and timely weather information is essential to effective winter weather event preparedness and subsequent snow and ice management. The city reviews all available weather information, including radar, satellite, local media forecasts, and road weather information systems.

The Emergency Services Manager (ESM) provides a strategic perspective on potential weather impacts, monitoring forecasts and convening briefings or conference calls with the National Weather Service (NWS), county, and state partners as needed. Additional forecasting and expert meteorological information will be provided by the University at Albany's Mesonet system, to provide multiple models for potential storms. The ESM ensures that all City agencies and departments are informed of potential impacts and that incident objectives and resource priorities are aligned citywide.

Prior to and during weather events, DPW maintains operational communications with the NWS through electronic updates and direct phone interactions specific to City impacts. DPW and ESM collaborate to identify commonalities between tactical and strategic considerations, ensuring operational plans—such as plow routes, equipment deployment, and snow removal priorities—are coordinated with broader citywide response objectives.

SNOW FLEET EQUIPMENT

The DPW maintains a Snow Fleet of plow trucks (used to plow the streets and apply salt) and front-end loaders (used to plow certain streets and remove snow) for snow plowing/clearing throughout the City. The fleet is based and maintained at the DPW's Snow Hub facility, the headquarters for the Streets and Sanitation Division. The current fleet is detailed in the Exhibits included in this report.

Plow trucks are converted from bulk trash and garbage support operations into plow trucks by October 15th, led by the Chief Mechanic. We are currently striving to improve and expand the City's plow fleet as quickly as possible, with 10 vehicles currently on order, 6 of which could potentially be ready for the last half of the winter season. DPW will strive to purchase enough plow trucks to maintain an operational fleet of 34 dual-axle trucks, which will be replaced every 5 years.

New for the 26-27 season, the City has purchased 5 smaller John Deere tractors that will be mounted with large snow blowers. These units will be deployed to some of Buffalo's narrowest streets, allowing for better maneuverability and clearance than a traditional plow.

The Engineering Division will outfit its fleet of pickup trucks and smaller vehicles with plows, allowing them to clear bike paths, viaducts, and other smaller city owned right of way.

For weather events that require snow plowing, the DPW fleet of plow trucks and front-end loaders provide the base level of operations. In addition to the City-owned fleet operated by DPW, the City also has the ability to engage other resources to assist with snow clearing/plowing in weather events. The NYSDOT can allocate resources to maintain designated state routes (these routes are termed "beat extensions") at the request of the City. A map highlighting the NYSDOT Beat Extensions is provided in the Exhibits.

For weather events that require snow removal, the City has four pools of resources that are available to assist:

- City owned equipment: the Snow Fleet of plow trucks and front-end loaders can perform snow removal as part of snow removal resources. Additional dump trucks are available within the department as well.
- City-engaged private contractors: a supplemental fleet of front-end loaders and dump trucks to assist in snow removal are contracted by the City for snow removal during the winter season.
- Erie County: a supplemental fleet of front-end loaders and dump trucks from Erie County private contractor sources, coordinated by the Commissioner of DPW, as county-wide conditions dictate equipment availability.
- New York State: snow removal equipment is available from New York State through the County's Disaster LAN (DLAN) program. City personnel are trained to utilize the DLAN system.

These combined resources (City-owned, privately-owned, Erie County facilitated, New York State facilitated) provide the physical resources necessary to handle a City-wide weather event. For the 2026-27 winter season, the City of Buffalo has currently budgeted $2.7 million for City-engaged private contractors.

CITY, COUNTY, STATE AND FEDERAL COOPERATION
The City coordinates closely with Erie County (County Executive's Office, Emergency Management Office, Department of Public Works) and New York State (Department of Homeland Security and Emergency Services, Department of Transportation and New York State Thruway Authority) to ensure a coordinated resource approach to major weather events. Throughout the winter season, regularly scheduled communications occur. However, during winter events, City, County and State officials at multiple levels are in contact throughout the event. Additionally, communications with the Federal Emergency Management Agency are established when required by the winter event.

Requests for additional equipment and supplies are submitted through the DLAN system and are closely coordinated between City, County and State officials.

COORDINATION WITH CRITICAL UTILITIES
Strategic coordination with National Grid, National Fuel, Buffalo Water, Buffalo Sewer Authority, Charter Communications, and other critical utilities occur through the City EOC, if activated. The DPW Snow Desk provides operational input, updates, and resource status to the EOC to ensure alignment with citywide priorities.

It is critical to note that National Grid has upgraded and added protection to its substations across the region to prevent the kind of freezing failure that occurred during the Christmas Blizzard. Widespread power outages are no longer likely during a snow event, even with Blizzard force winds.

SNOW STORAGE
When significant amounts of snow fall during individual, consecutive events or over the course of multiple events in the season, the snow can no longer simply be plowed to the side – it must be removed in its entirety. When snow removal procedures are implemented, the DPW may engage in any combination of City-engaged private contractors, county-facilitated private contractors or state-facilitated private and municipal contractors. All contractors will be directed to specific snow storage locations to deposit snow removed (See Exhibits).

Additional sites will be made available as required during events, as snow volumes dictate.

STAFFING
During the winter season, the DPW staffing levels are based on full utilization of personnel during the snow and ice season to provide staffing by a three-shift model. During a snow event, all shifts are designed for 12 hours (or 16 hours, as needed) dividing the personnel between plows and front-end loaders. Personnel will be offered 4- or 8-hour overtime blocks to supplement the workforce assigned to shifts immediately before and after their individual shift. All other Streets Department duties will be suspended (including Sanitation's large three-piece standard pickup and "pick and pays") at the start of the significant winter event in order to focus on snow plowing/clearing operations. When a Tier 2 or Tier 3 event occurs, regular daily sanitation pickup may be paused for a short period of time during snow removal operations.

ICE AND SNOW CONTROL
"Bare" or "dry" pavement surfaces are the optimum condition for safe driving. All efforts are made to manage road conditions during the winter season and certainly during a weather event. The unpredictable and varying nature of weather and finite available resources preclude the possibility of optimum conditions on all City streets all the time. The DPW's Division of Streets strives to ensure the safest possible pavement surfaces that are possible under climate conditions and with available resources for snow and ice control.

The two general principles that apply to effective ice control are:

- **"Prevent Pack – Don't Melt It":** The application of salt, very early in the weather event, with appropriate follow-up applications, will generally prevent ice pack from forming. This strategy is more effective and safer than trying to remove pack once it has formed.
- **"If Salt Will Work – Use It":** If conditions are favorable, salt is the first choice of materials that should be used for ice control. The overall utilization of resources for combating ice pack will be far greater than if salt is used in a timely manner.

MATERIAL USED FOR ICE CONTROL
Although there are numerous methodologies for snow and ice control, the City primarily uses rock salt to melt the ice, the most commonly used practice across the snow control industry. The effectiveness of rock salt, or Sodium Chloride (NaCl), to melt ice and/or form brine is highly temperature dependent and significantly drops as the temperature approaches 20 degrees and below. Typical effectiveness of rock salt, established in "controlled environments" and not in the field, is as follows:

Temperature (F) One pound of rock salt melts:

- 30° 46 lbs of ice
- 20° 9 lbs of ice
- 10° 5 lbs of ice
- 0° 4 lbs of ice

Effectiveness decreases as temperature drops

At the start of a typical winter, the City will have 3,500 tons of salt stored at the DPW Snow Hub and an emergency stockpile at its offsite location(s). For the Winter 2026-27 season, the City of Buffalo has established two purchase agreements to procure the needed minimum of 25,000 tons of salt, and we are actively pursuing a third bid to ensure supply, in the event that there are additional challenges at the American Rock Salt mine in Livingston County.

From a utilization standpoint, salt is utilized for ice control and not for snow control. The more snow events that occur, the less salt that is typically used because the focus on clearing the roadway of snow first and then salting at the end of the snow event. In efforts to maximize monetary and operational efficiency, salt is not typically applied in the midst of a snowfall event, as the salt will simply be plowed to the sides during road clearing.

RESIDENTIAL STREET PROTOCOL

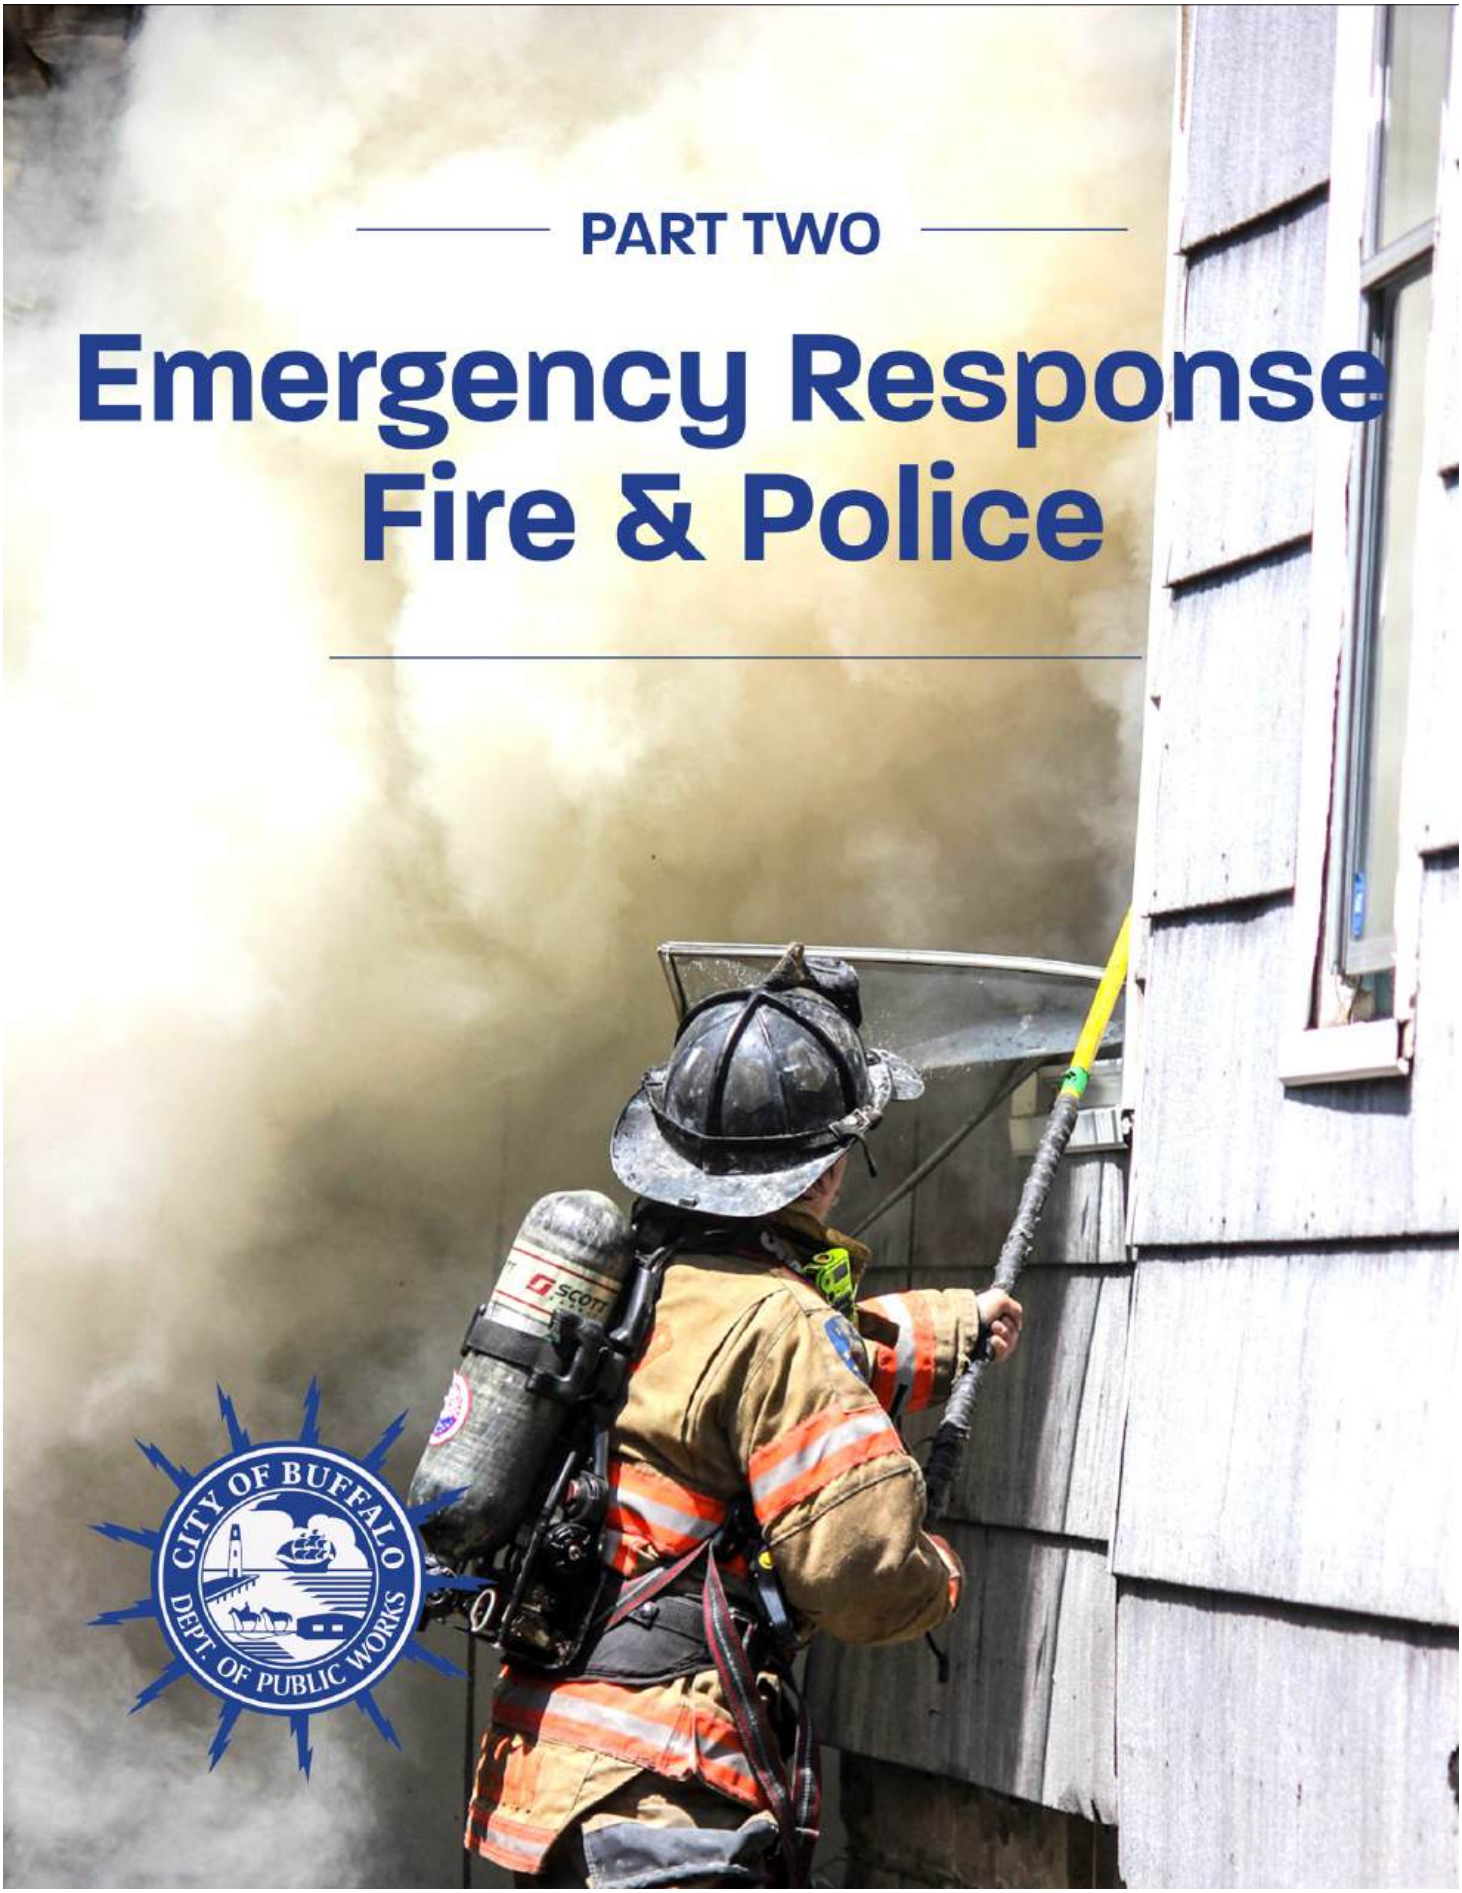

The main goal in snow plow operations is to initially focus on primaries and secondaries and streets/thoroughfares surrounding critical City services and/or life-saving facilities – critical city service facilities, fire houses and police stations. The primaries and secondaries include the NFTA bus routes (see Exhibits).

This initial focus on these streets is required to help ensure that overall traffic flow in/out of the City is operational. This prioritization ensures the continuous operation of these vital facilities and services in the event of an emergency. Following that initial focus, the shift to residential streets occurs. It is important to note, the clearing of streets is a fluid process as the amount of snow can vary in differing parts of the City, and as such, some neighborhoods may see the transition to the residential streets sooner than others.

Within 24 hours of the end of a snow event, the goal of the DPW is to complete at least one (1) snow plow pass on every residential street in the City of Buffalo. The first priority is to always keep primary streets, evacuation routes and secondary streets clear. Because of this, snow accumulation on some residential streets may be greater than usual during severely heavy and/or continuous snow storms.

PART TWO

Emergency Response Fire & Police

EMERGENCY RESPONSE
FIRE & POLICE

As stated in the Introduction, while the DPW leads snow and ice clearing operations, other City Departments have responsibilities that support preparedness, response, continuity of essential services, and recovery before, during, and after a winter event.

If a Tier 2 or 3 event is anticipated, contractor-operated snow removal equipment may be staged at fire houses and/or police stations, as determined in coordination with the DPW.

BUFFALO FIRE DEPARTMENT
Prior to the onset of significant winter weather impacts, the BFD will participate in internal preparedness meetings convened by the Mayor or designee.

Based on forecasted conditions and anticipated operational impacts, BFD may adjust staffing, station readiness, equipment, and other resources as necessary to maintain emergency response capability.

BFD may pre-position or request additional equipment, supplies, and other resources through established City, County, State, or mutual-aid resource processes.

The BFD maintains specialized vehicles and equipment, including snowmobiles and UTVs, that may be deployed to support emergency response and access when severe winter weather conditions affect conventional vehicle operations.

BUFFALO POLICE DEPARTMENT
Prior to the onset of significant winter weather impacts, the BPD will participate in internal preparedness meetings convened by the Mayor or designee.

Based on forecasted conditions and anticipated operational impacts, BPD may adjust staffing, station readiness, equipment, and other resources as necessary to maintain public safety and emergency response capability.

BPD may deploy personnel as necessary to support traffic control, road closures, emergency protective measures, access for emergency responders, and other public safety operations based on conditions and operational requirements.

The BPD maintains specialized vehicles and equipment, including drones, UTVs (Utility Task Vehicles) equipped with track treads, and a four-wheel-drive command vehicle, that may be deployed to support public safety and emergency response operations during severe winter weather conditions.

PART THREE
Communication Protocols
CITY OF BUFFALO
DEPT. OF PUBLIC WORKS

COMMUNICATIONS PROTOCOLS

To provide timely warnings, clarity and transparency to our residents, the City has established a communication plan that includes pre-event, ongoing event messaging as needed, and post-event messaging delivered through the Mayor's Office of Communications. The plan uses an array of messaging platforms to deliver important citywide information and updates effectively, from traditional press conferences, digital message boards and social media channels from the City, Mayor, Buffalo Police, 311, and the Government Channel, as well as the Office of Emergency Management's NextDoor account.

Additionally, during extreme weather events, when there is advance warning, the messaging delivered to the public will include strong specific language that emphasizes the potential life-threatening consequences of not following the City's warnings to – stay at home, shelter in place, or stay off the roads. Sample directions used in public messaging could include: **Winter Emergency! Shelter in Place! If you go outside, it could result in serious injury or death.**

PRE-EVENT MESSAGING

Working closely with the National Weather Service (NWS) to obtain the latest weather updates and anticipated event impacts, the City will relay information to the community in an effort to enhance awareness. When a significant weather event is approaching, the Mayor's Office of Communications will provide timely updates to the community utilizing multiple communication platforms, which may include the following:

- **BUFFALERT Notifications** – the City maintains an emergency text and email messaging system that is used to deliver important weather event information and updates. The BUFFALERT system will be used throughout the entirety of any event. The City encourages everyone to register for BUFFALERT by texting your zip code to 38276. BUFFALERT can be customized by users to provide information in varying languages by signing up at www.buffalony.gov/buffalert.

- **City EOC Coordination:** When the City Emergency Operations Center (EOC) is activated, staffing for liaison officers (LNOs) will include personnel from County and State agencies to support coordination, resource allocation, and interagency communication related to the operation of emergency warming centers, road closures, and other critical services.

- **Media Communications** – as weather events approach, the City will provide information to media outlets (TV, radio and print) that provide updated weather information and potential event impacts, and guidance.

- **Press Conferences** – for significant events affecting the City, the Mayor's Office of Communications will work closely with the local media outlets (TV, radio and print) and provide critical community information at press events.

- **Winter Safety Public Service Announcements** – The City and Charter Communications partnered to produce several public service announcements aimed at educating residents about how to stay safe during winter weather emergencies. The public service announcements will start airing December 1st on Spectrum Television Channels in Buffalo and throughout the WNY region.

- **Variable Message Signage (VMS)** – the City will place multiple VMS boards to deliver messaging in high-traffic areas. As the event dictates, the VMS boards will be placed at strategic locations throughout the City in an effort to message motorists.

- **Coordinated City-County Messaging** – for significant region-impacting events, the City and County will deliver coordinated messaging through multiple channels.

- **Wireless Emergency Alert (WEA)** – for extreme weather event messaging, messages will be broadcast via the Integrated Public Alert Warning System (IPAWS) to any WEA-enabled mobile device in the targeted area. Due to the increasing shift away from traditional news consumption, IPAWS alerts may be the only way to warn large portions of Buffalo's population.

- **Communications for Persons who are Deaf or Hard of Hearing** – Interpretive services for the hearing impaired will be requested for in-person communication events.

- **Community Organizations Active in Disaster (COAD)** - The Erie County Emergency Operations Center will active the COAD group ahead of any major storm. This group includes dozens of Buffalo not-for-profit and community groups, who will disseminate critical storm information to their groups including Buffalo's immigrant and non-English speaking communities.

Communications will include multiple City departments and agencies, as appropriate to the event, including but not limited to the Mayor's Office, Department of Public Works, Community Services, Buffalo Police Department, Buffalo Fire Department, Citizen Services, Parking Division, and other departments or agencies as necessary.

When conditions warrant EOC activation, interdepartmental communication and coordination will be supported through the City EOC. Operational updates and other pertinent information will be shared through established EOC communication processes.

ONGOING EVENT MESSAGING

During weather events, the City will regularly provide updated information to our residents as necessary. Information will be provided through multiple platforms and include numerous aspects of the City's response.

SNOW FLEET LOCATION INFORMATION

Using new technology, the Department of Management Information Services, in conjunction with DPW leadership, will be deploying an all-new, more accurate snowplow mapping system.

The new system will utilize real-time telemetry from SAMSARA devices in conjunction with ESRI GIS technology to provide improved visibility into the location and movement of the City's snow fleet.

This enhanced mapping capability will provide DPW leadership and staff with more accurate, timely information to support snow-removal operations, fleet coordination, and overall response efforts.

This image provides a sample view of the status information available on the Snow Route Status application available to the public.

- **Green Street Segments:** serviced 1-3 hours ago*
- **Light Blue Street Segments:** serviced 3-6 hours ago*
- **Dark Blue Segments:** serviced 6-12 hours ago*
- **Purple Segments:** serviced 12-24 hours ago*
- **Yellow Street Segments:** serviced 24-36 hours ago*
- **Red Street Segments:** serviced more than 36 hours ago*

** Colored segments on the map do not automatically indicate that a roadway is safe or clear for travel. Instead, the colored segments provide a time stamp indicating when City snow-plowing or snow-clearing services were last recorded on that specific street.*

Equipment that is not operated by the City—including County, State, and private snow-removal equipment—is not equipped with the GPS tracking technology necessary to update the Snow Route Status Map. As a result, street-clearing activities performed by this equipment may not appear on the Snow Route Status Map in real time or on a regular basis, based on available technology. The Department of Public Works (DPW) continues to monitor all street-clearing activities during winter events through integrated digital mapping technology supported by visual inspections conducted by winter event inspection personnel.

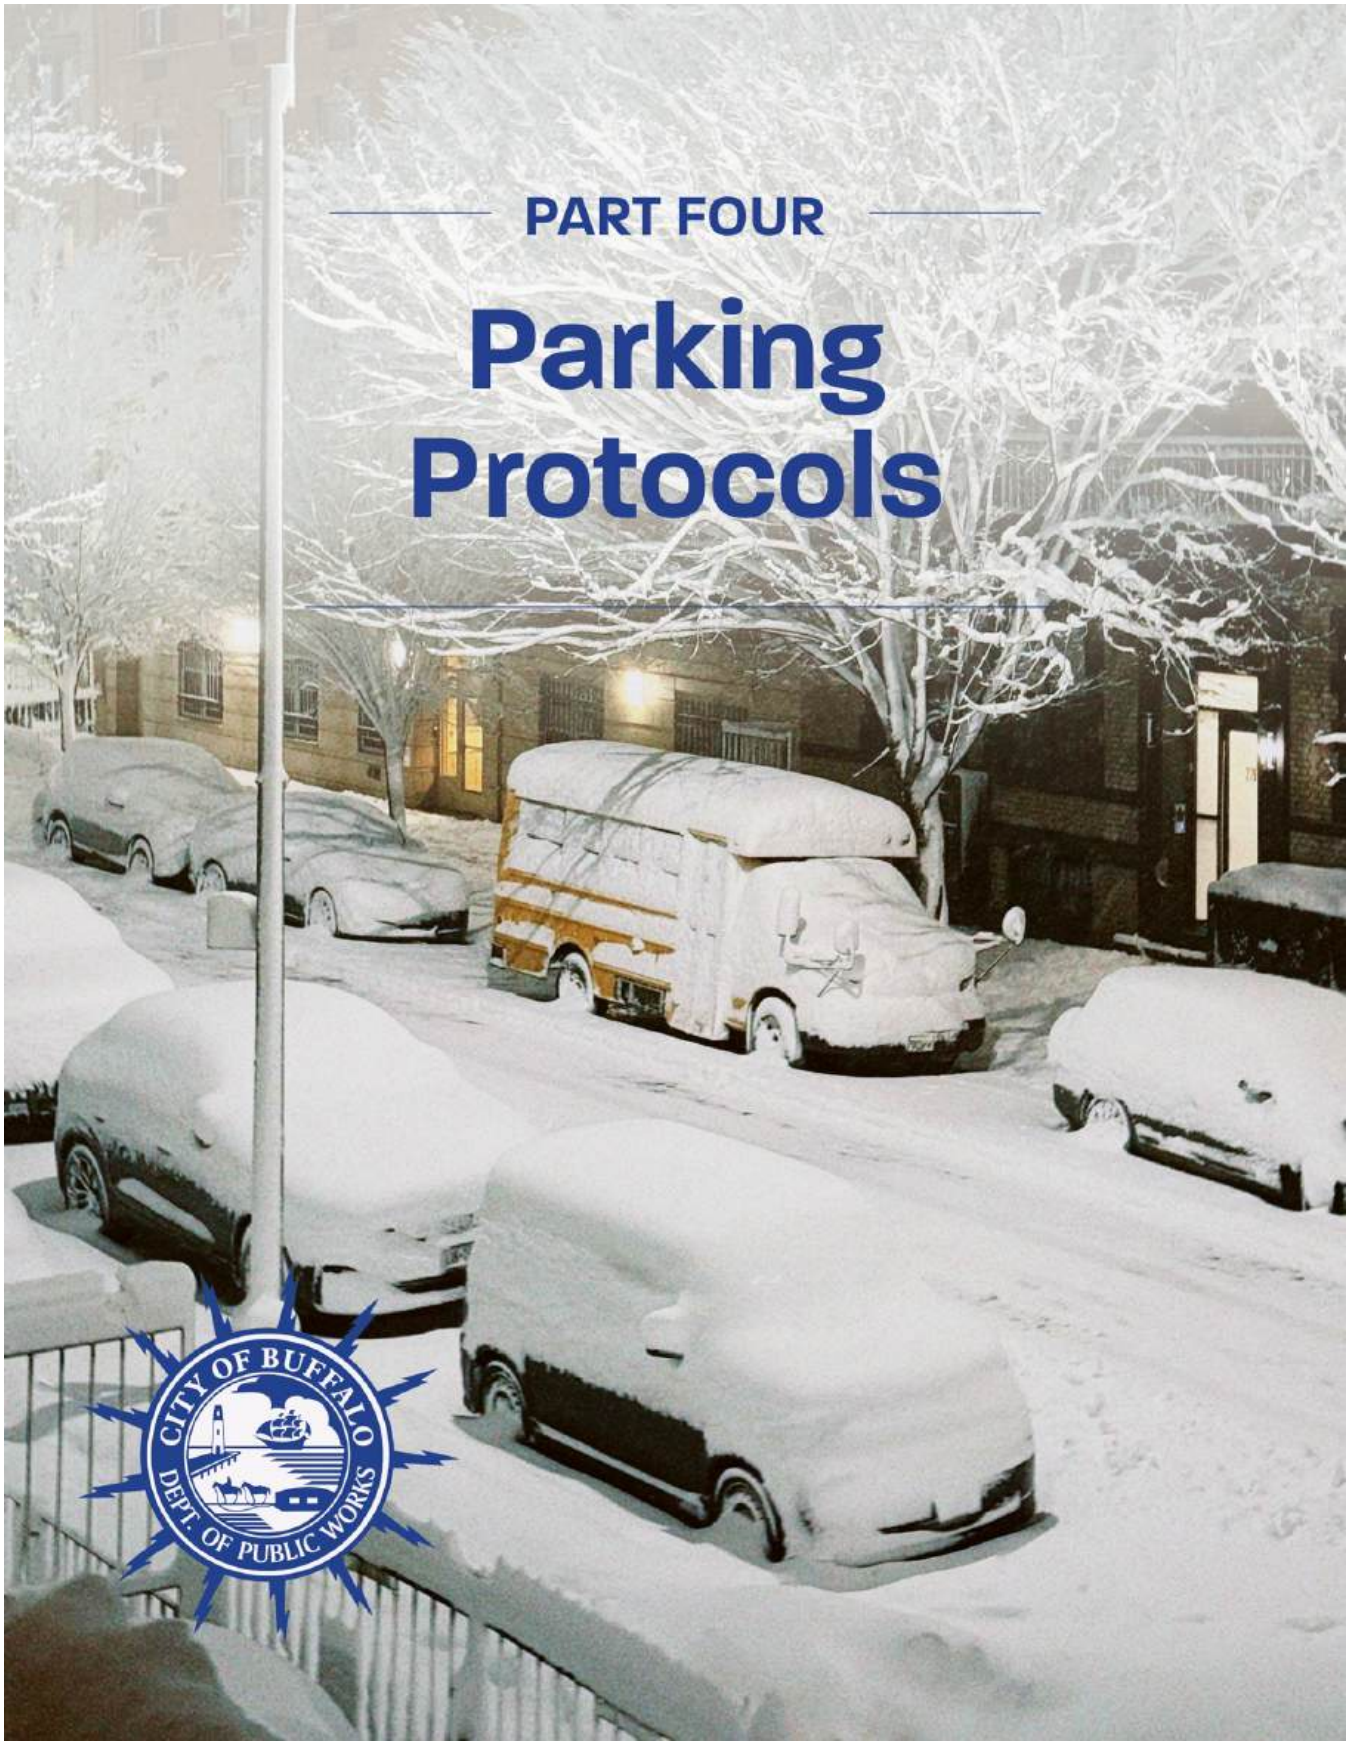

RECOVERY / POST-EVENT MESSAGING

As the weather event transitions, the city provides continual updates to the community through multiple platforms. For significant events, the ESM coordinates with all agencies and departments to assess response efforts and identify areas for improvement. Agencies submit a summary of operational activities and lessons learned to the ESM, who consolidates the information into a draft After-Action Report (AAR) for review by the mayor's staff.

The Post-Event Report submitted to the Common Council will include:

- Timeline of the snow event – start, end, and duration
- Street clearing overview/summary – primary, secondary, and residential streets
- Salt utilization
- Expense/cost overview
- Manpower and overtime expenditures
- Equipment status, including repairs and service needs
- Overview of 311 reports to identify areas for improvement
- Parking enforcement statistics
- Snow removal/clearing special topics/issues
- Communications and messaging details
- Inter-agency cooperation summary

This coordinated approach ensures that city leadership, the Common Council, and other stakeholders are provided with a comprehensive view of operational successes, challenges, and recommendations for future events.

PART FOUR
Parking Protocols
CITY OF BUFFALO
DEPT. OF PUBLIC WORKS

PARKING PROTOCOLS

WINTER PARKING MODIFICATIONS

In order to clear the streets effectively during major winter snow events, the City requires winter parking changes that provide the access and clearances required for street clearing equipment and emergency equipment. As we are all aware, streets across the City are very narrow, especially in the older neighborhoods and sections of the City, and thus present significant challenges if the parking is not modified. The main focus of the parking restrictions is to maximize the DPW snow fleet's ability to provide adequate snow clearing services and maintain emergency access without creating a hardship for residents. The Parking Department works closely with the DPW on these seasonal changes and are charged with enforcing the winter season parking changes.

The winter parking modifications typically go into effect on November 15 of each year and last through April 1 of the following year. However, the dates for the start and end of the season may be modified as weather conditions allow. For instance, if winter weather is not expected to hit the City on November 15, the City may elect to extend the summer parking model until such time as weather patterns dictate. Additionally, during the winter season, the City may also modify these restrictions as weather patterns dictate.

OFF STREET PARKING CITY SITES

The City has identified numerous City-owned parking lots that can be used during a snow emergency event for residents to park their vehicles off of the street. When a Tier 2 or Tier 3 event is predicted to occur, the Office of Communications in cooperation with the Parking Department will announce when residents can use these lots. Possible parking areas are identified in the listing below:

DELAWARE DISTRICT
569 / 573 Forest Avenue
1466 Hertel Avenue
1509 Hertel Avenue

ELLICOTT DISTRICT
1406 Fillmore Avenue
1354 Jefferson Avenue
92 / 102 / 104 Orange Street

FILLMORE DISTRICT
1193 Broadway Avenue
132 /134 Clare Street
248 Gibson Street
198 Allen Street
252 Allen Street

LOVEJOY DISTRICT
1111 Lovejoy Avenue
1930 Clinton Street

MASTEN DISTRICT
3102 Bailey Avenue
866 East Delavan Avenue
283 / 285 / 289 Glenwood Avenue

NIAGARA DISTRICT
37 / 43 / 53 Auchinvole Avenue & 274 / 278 / 280
Breckenridge Street
301 Bryant Street
182 / 186 Grant Street
304 West Utica Street

NORTH DISTRICT
641 Hertel Avenue (foot of Farmer)
186 Hertel Avenue
195 Military Road
378 / 380 Military Road
394 /396 Hertel Avenue

UNIVERSITY DISTRICT
22 / 26 Heath Street
3274 Main Street
31 Winspear Avenue

SOUTH DISTRICT
35 Cazenovia Street

OFF STREET PRIVATE PARKING

The City will work closely with private entities as weather patterns dictate to provide additional locations where residents may park their vehicles during major snow events. Those will be communicated to the residents specific to each event. For example, the Richardson Complex off of Forest Avenue could be used during storms.

SPECIALIZED VEHICLE RELOCATION EQUIPMENT

The Parking Department maintains specialized equipment to support vehicle relocation during extreme winter weather events. This equipment supplements or, when conditions warrant, replaces traditional tow trucks when heavy snow or other winter weather conditions make conventional towing operations difficult.
